Examiner, Art Unit 2617

U.S. Patent and Trademark Office

Supervisory Patent Examiner, Art Unit 2617

Continuation of 11, does NOT place the application in condition for allowance because:

The Examiner has carefully considered Applicant's Request for Consideration filed on 08/03/2009 but respectfully disagrees with Applicant's interpretation of the Alastalo reference as explained below.

In page 3 of the Remarks, the Applicant correctly states that Alastalo describes a method for dealing with multiple packets in a single lance sits, and that Alastalo describes that each of the packets must have the same neight properly detect acknowledgments of each packet, but then concludes that since padding is only needed in the last packet to match this packet's length to the earlier packets, such a scheme their packets, and the select a transmission block size smaller that the amount of data buffered, and that otherwise must be used to the conclusion the Examiner believes that the Applicant is relying on column 3, lines 44-48 of Alastalo, where it is disclosed that the data to be communicated is divided into data framements.

However this corresponds to an embodiment that is different from the embodiment relied upon by the Examiner. In rejecting claim 1 the Examiner has relied upon a different embodiment taught by Alastalo. In column 3, lines 14-3, Alastalo clearly explains that a determination is made of the relative lengths of the data packets to be communicated, and that data which is of a lesser length is padded so that all the packets have the same length. Alastalo further explaims in column 3, lines 38-43 that modulation is used to tune the packet length in order to reduce the amount of padding. As best understood by the Examiner Alastalo determines the packet size to be equal to the longest data to be transmitted and changes the modulation in order to try to fit data (i.e. data shorter than the longest data) to the longest packet size trying to minimize the amount of required padding. According to the Examiner this reads on "selecting a modulation scheme from the list using a smallest available transmission block size that is greater than or equal to the amount of data buffered" as recited in claim 1 and therefore the final rejection is maintained by the Examiner.
